

OWNER:

PROJECT SIZE: 12km Pipeline

COMPLETION DATE:

PRODUCT: **MetalSafe B-300**

**Job Description:**

Above ground pipelines are often exposed to severe weather conditions leading to accelerated corrosion and premature loss of service life.

Located in a remote area and region of Venezuela, this 12km pipeline needed a protective corrosion membrane applied in an efficient manner.

Loose scale and rust were removed using a 400 psi water jet.

An instant-set coating of MetalSafe B-300 was applied using the dual fluid HVLP 200 in a single application of 1.5mm. The membrane cured to full strength in less than 24 hrs.

MetalSafe B-300 was chosen because of its ability of minimal surface preparation (can be applied over light rust layers). Has excellent resistance to UV degradation. Membrane will not burn if exposed to high temperatures. It's environmentally safe with no solvents or VOC's. Quick and easy to apply in harsh environments.
