

OWNER: **Syncrude Oilsands Mine Site – Spence Corrosion**

PROJECT SIZE: **1200 sq ft**

COMPLETION DATE: **2012**

PRODUCT: **MetalSafe B-300**

Job Description:

Syncrude is one of the largest producers of crude oil from Canada's oil sands. They operate a large oil sand mine, utilities plant, bitumen extraction plant and upgrading facility that processes bitumen and produces value-added light, sweet crude oil for domestic consumption and export.

With a tight timeline during a shutdown, they needed their clarifying tank to be addressed for corrosion and pin holes.

MetalSafe B-300 not only protects metal surfaces from the effects of rust caused by water, but protects surfaces from the harmful effects of salts, phosphates and chemicals that can damage metal and shorten the life of the facilities.

Following the preparation of the surface, HighBuild S-200 was used to prepare seams, cracks and irregularities. MetalSafe B-300 was spray applied as an "instant-set" protective liner. The instant-set application procedure enables the contractor to control the liner thickness to the recommended 80 mil (2mm), using a single pass, saving time and ensuring complete coverage.
