

Product: CreteSafe B-250
Purpose: Waterproofing
Industry: Construction - Building
Client: Homeowner
Location: Sherwood Park, Alberta, Canada
Distributor: Liquid Rubber Canada
Project Size: 5,000 sq.ft.
Completed At: August 2011

Problems

- Waterproofing Quad Lock Insulated Concrete Forms (ICF's) with a non-solvent based product in a time efficient manner with ease of application.

Solutions

- Liquid Rubber CreteSafe B-250 was used because it contains no solvents (or VOC's) that will damage the ICF's. It is easily applied in 1 application due to it's "instant setting" properties. A drainage/dimple board was added to provide extra protection for waterproofing and against backfill damaging the blocks.

Advantages

- Liquid Rubber can be applied up to 8000 sq ft/ day when time is of the essence. It provides a waterproof membrane which stops the infiltration of water as opposed to dampproofing which only slows the infiltration of water.
